NLP: Computers that Can Understand (and So Also Communicate in) Human Language

We will focus today only on textual data

Opinion Mining

Spam Detection

Language Translation
Why Discuss NLP With RNNs?

• RNNs have a strong track record for NLP problems
• Text data’s representation (i.e., sequential data) is a natural match for RNNs
Historical Context: Origins of NLP

Research community emerged mostly on the problem of translating languages.

1847: Gradient descent
1945: First programmable machine
1950: Turing test
1956: AI Perceptron
1959: Machine learning
2012: Wave 3: rise of “deep learning”

NLP in Context

Artificial Intelligence
(machines that do “intelligent” things)

Today’s Topics

• Introduction to natural language processing

• Text representation

• Neural word embeddings

• Programming tutorial
Input: String (Collection of Characters)

- **Common terms**
  - **Corpus:** dataset
  - **Document:** example

---

**Machine learning**

> From Wikipedia, the free encyclopedia

> For the journal, see Machine Learning (journal).

> "Statistical learning" redirects here. For statistical learning in linguistics, see statistical learning in language.

**Machine learning** is a field of computer science that uses statistical techniques to give computer systems the ability to "learn" (e.g., progressively improve performance on a specific task) with data, without being explicitly programmed.\(^2\)

The name **machine learning** was coined in 1959 by Arthur Samuel.\(^1\) Machine learning explores the study and construction of **algorithms** that can learn from and make predictions on **data**\(^3\) – such algorithms overcome following strictly static **program instructions** by making data-driven predictions or decisions,\(^4\)\(^2\) through building a **model** from sample inputs. Machine learning is employed in a range of computing tasks where designing and programming explicit algorithms with good performance is difficult or infeasible; example applications include **email filtering**, detection of network intruders, and **computer vision**.
Input: Which “String” Feature Types Apply?

- Categorical data
  - Comes from a fixed list (e.g., education level)

- Structured string data
  - e.g., addresses, dates, telephone numbers

- Text data
How to Describe Text to a Computer?

• Challenge: input often varies in length

• Solution: convert text to numeric format that DL algorithms can handle
Implementation Details – Possible Pre-processing

• Lower case all letters
• Stemming: use each word’s stem; e.g., singular to plural, resolve different verb forms
  • e.g.,

  ![Diagram showing stem removal process](https://dzone.com/articles/using-lucene-grails)

• Stop word removal: discard frequent words

![Image illustrating common stop words](https://github.com/topics/stopwords-removal)
Converting Text to Vectors

1. Tokenize training data
2. Learn vocabulary
3. Encode data as vectors
Converting Text to Vectors

1. Tokenize training data; convert data into sequence of tokens (e.g., data -> “This is tokening”)
2. Learn vocabulary
3. Encode data as vectors

Two common approaches:

**Character Level**

```
[This is tokenizing .]
```

**Word Level**

```
[This] [is] [tokenizing] .
```
Converting Text to Vectors

1. Tokenize training data
2. Learn vocabulary by identifying all unique tokens in the training data
3. Encode data as vectors

Two common approaches:

<table>
<thead>
<tr>
<th>Token</th>
<th>a</th>
<th>b</th>
<th>c</th>
<th>***</th>
<th>0</th>
<th>1</th>
<th>***</th>
<th>!</th>
<th>@</th>
<th>***</th>
</tr>
</thead>
<tbody>

Converting Text to Vectors

1. Tokenize training data
2. Learn vocabulary by identifying all unique tokens in the training data
3. Encode data as one-hot vectors

https://github.com/DipLernin/Text_Generation

One-hot encodings

Input sequence of 40 tokens representing characters or words

recurrent layer

softmax

output
Converting Text to Vectors

What are the pros and cons for using word tokens instead of character tokens?

- **Pros:** length of input/output sequences is shorter, simplifies learning semantics
- **Cons:** “UNK” word token needed for out of vocabulary words; vocabulary can be large

<table>
<thead>
<tr>
<th>Token</th>
<th>a</th>
<th>b</th>
<th>c</th>
<th>***</th>
<th>0</th>
<th>1</th>

Word level representations are more commonly used

[https://nlpiation.medium.com/how-to-use-huggingfaces-transformers-pre-trained-tokenizers-e029e8d6d1fa](https://nlpiation.medium.com/how-to-use-huggingfaces-transformers-pre-trained-tokenizers-e029e8d6d1fa)
Problems with One-Hot Encoding Words?

- Huge memory burden
- Computationally expensive

Dimensionality = vocabulary size

e.g., English has \(~170,000\) words with \(~10,000\) commonly used words

Limitation of One-Hot Encoding Words

- No notion of which words are similar, yet such understanding can improve generalization
  - e.g., “walking”, “running”, and “skipping” are all suitable for “He was ____ to school.”

The distance between all words is equal!
Today’s Topics

• Introduction to natural language processing

Idea: Represent Each Word Compactly in a Space Where Vector Distance Indicates Word Similarity

Inspiration: Distributional Semantics

“The distributional hypothesis says that the meaning of a word is derived from the context in which it is used, and words with similar meaning are used in similar contexts.”

- Origins: Harris in 1954 and Firth in 1957
Inspiration: Distributional Semantics

“The distributional hypothesis says that the meaning of a word is derived from the context in which it is used, and words with similar meaning are used in similar contexts.”

Inspiration: Distributional Semantics

• What is the meaning of berimbau based on context?

  Background music from a berimbau offers a beautiful escape.

  Many people danced around the berimbau player.

  I practiced for many years to learn how to play the berimbau.

• Idea: context makes it easier to understand a word’s meaning

[Adapted from slides by Lena Voita]
Inspiration: Distributional Semantics

“The distributional hypothesis says that the meaning of a word is derived from the context in which it is used, and words with similar meaning are used in similar contexts.”

Inspiration: Distributional Semantics

• What other words could fit into these contexts?

1. Background music from a _______ offers a beautiful escape.
2. Many people danced around the _______ player.
3. I practiced for many years to learn how to play the _______

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Berimbau</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Soap</td>

<td>0</td>
</tr>
<tr>
<td>Fire</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Guitar</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Hypothesis is that words with similar row values have similar meanings.

Contexts: 1 if a word can appear in the context, 0 otherwise.
Inspiration: Distributional Semantics

“The distributional hypothesis says that the meaning of a word is derived from the context in which it is used, and words with similar meaning are used in similar contexts.”

Approach

• Learn a dense (lower-dimensional) vector for each word by characterizing its context, which inherently will reflect similarity/differences to other words.

Berimbau and guitar are the closest word pair. The distance between each pair of words differs!

Note: many ways to measure distance (e.g., cosine distance)
Approach

• Learn a dense (lower-dimensional) vector for each word by characterizing its context, which inherently will reflect similarity/differences to other words.

We embed words in a shared space so they can be compared with a few features.

What features would discriminate these words?

Berimbau

Soap

Fire

Guitar
Approach

- Learn a dense (lower-dimensional) vector for each word by characterizing its context, which inherently will reflect similarity/differences to other words.
Approach: Learn Word Embedding Space

• An embedding space represents a finite number of words, decided in training
• A word embedding is represented as a vector indicating its context
• The dimensionality of all word embeddings in an embedding space match
  • What is the dimensionality for the shown example?
Approach: Learn Word Embedding Space

• An embedding space represents a finite number of words, defined in training
• A word embedding is represented as a vector indicating its context
• The dimensionality of all word embeddings in an embedding space match

In practice, the learned discriminating features are hard to interpret
Embedding Matrix

- The embedding matrix converts an input word into a dense vector

Embedding Matrix

• It converts an input word into a dense vector

A word’s embedding can efficiently be extracted when we know the word’s index

Popular Word Embeddings

• Bengio method

• Word2vec (skip-gram model)

• And more...
Popular Word Embeddings

Idea: Learn Word Embeddings That Help Predict Viable Next Words

e.g.,

1. Background music from a _______

2. Many people danced around the _______

3. I practiced for many years to learn how to play the _______

Task: Predict Next Word
Given Previous Ones

e.g.,

1. Background music from a _______

2. Many people danced around the _______

3. I practiced for many years to learn how to play the _______
Task: Predict Next Word Given Previous Ones

e.g., a vocabulary size of 17,000 was used in experiments

What is the dimensionality of the output layer?

Architecture

Word embeddings:

Embedding matrix:

Table look-up in $C$

Matrix $C$

shared parameters across words

$i$-th output = $P(w_t = i \mid \text{context})$

softmax

most computation here

tanh
Architecture

- A vocabulary size of 17,000 was used with embedding sizes of 30, 60, and 100 in experiments.

- Assume a 30-d word embedding; what are the dimensions of the embedding matrix $C$?

  $30 \times 17,000$ (i.e., 510,000 weights)

Reference:

e.g., a vocabulary size of 17,000 was used with embedding sizes of 30, 60, and 100 in experiments

Assume a 30-d word embedding - what are the dimensions of each word embedding?

1 x 30
Architecture

Projection layer followed by a hidden layer with non-linearity

\[ i\text{-th output} = P(w_t = i \mid \text{context}) \]

Training

Use sliding window on input data; e.g., 3 words

Background music from a berimbau offers a beautiful escape...

Input: tried 1, 3, 5, and 8 input words and used 2 datasets with ~1 million and ~34 million words respectively

Training

Use sliding window on input data; e.g., 3 words

Background music from a berimbau offers a beautiful escape...

Extra Tricks: More Efficient Representations

1. Change output layer to hierarchical softmax

2. Reformulate problem to perform negative sampling

Binary classification: predict for a given word if another word is nearby
- Positive examples: observed target and neighboring words
- Negative examples: randomly sampled other words

Hyperparameters: What Works Well?

• Word embedding dimensionality?
  • Dimensionality set between 100 and 1,000

• Context window size?
  • ~10

Very Exciting/Surprising Finding

• Vector arithmetic with word embeddings can solves many analogies
  
  *(Full test list: [http://download.tensorflow.org/data/questions-words.txt](http://download.tensorflow.org/data/questions-words.txt))*

• **Semantic** relationships (meaning of words in a sentence):
  • Italy + (Paris - France) = Rome

• **Syntactic** relationships (rules for words in a sentence)
  • smallest + (big – small) = biggest
  • think + (read – reading) = thinking
  • mouse + (dollars – dollar) = mice

Summary: Word Embeddings Are Learned that Support Predicting Viable Surrounding Words!

e.g.,
1. ___ ___ ___ ___ berimbau ___ ___ ___ ___ ___ ___
2. ___ berimbau ___
Popular Word Embeddings

- Bengio method
- Word2vec (skip-gram model)
- And more...
Variants for Learning Word Embeddings

• Capture global context rather than just local context of previous or surrounding words; e.g.,
  • GloVe for Global Vectors (Pennington et al., 2014)

• Capture that the same word can have different word vectors under different contexts; e.g.,
  • Elmo for embeddings from language models (Peters et al., arXiv 2018)

• Support multiple languages; e.g.,
  • Fast-text (Bojanowski et al., 2016)
Popular Word Embeddings

• Bengio method

• Word2vec (skip-gram model)

• And more...
Recap of Big Picture

• Convert words into compact vectors as input to neural networks; e.g., RNNs

• Implementation detail: may need to learn extra tokens such as “UNK” and “EOS” to represent out of vocabulary words and signify end of the string respectively

• Also, can fine-tune word embedding matrices for different applications

Word Embedding Limitations/Challenges

• Distinguish antonyms from synonyms
  • Antonyms are learned near each other in the embedding space since they are commonly used in similar contexts: “I hate math” vs “I love math” or “Take a right turn” vs “Take a left turn”

• Gender bias:

<table>
