No Silver Bullet

Kenneth M. Anderson Foundations of Software Engineering CSCI 5828 - Spring Semester, 2001 Guest Lecture

Today's Lecture

- Discuss the No Silver Bullet paper
- Brook's reflections on it after nine years

March 14, 2001

No Silver Bullet

- "There is no single development, in either technology or management technique, which by itself promises even one order-ofmagnitude improvement within a decade in productivity, in reliability, in simplicity."
 - -- Fred Brooks, 1986

i.e. There is no magical cure for the "software crisis"

Why? Essence and Accidents

- Brooks divides the problems facing software engineering into two categories
 - essence
 - difficulties inherent in the nature of software
 - accidents
 - difficulties related to the production of software
- Brooks argues that most techniques attack the accidents of software engineering

3

March 14, 2001

An Order of Magnitude

- In order to improve the development process by a factor of 10
 - the accidents of software engineering would have to account for 9/10ths of the overall effort
 - tools would have to reduce accidents to zero
- Brooks

March 14, 2001

- doesn't believe the former is true and
- the latter is highly unlikely, even if it was true

The Essence

- Brooks divides the essence into four subcategories
 - complexity
 - conformity
 - changeability
 - invisibility
- Lets consider each in turn

Complexity

- Software entities are amazingly complex
 - No two parts (above statements) are alike
 - Contrast with materials in other domains
 - They have a huge number of states
 - Brooks claims they have an order of magnitude more states than computers (e.g. hardware) do
 - As the size of the system increases, its parts increase exponentially

Complexity, continued

• Problem

March 14, 2001

- You can't abstract away the complexity
 - Physics models work because they abstract away complex details that are not concerned with the essence of the domain; with software the complexity is part of the essence!
- The complexity comes from the tight interrelationships between heterogeneous artifacts: specs, docs, code, test cases, etc.

7

5

Complexity, continued

- Problems resulting from complexity
 - difficult team communication
 - product flaws
 - cost overruns

March 14, 2001

- schedule delays
- personnel turnover (loss of knowledge)

- unenumerated states (lots of them)
- lack of extensibility (complexity of structure)
- unanticipated states (security loopholes)
- project overview is difficult (impedes conceptual integrity)

Conformity

- A significant portion of the complexity facing software engineers is arbitrary
 - Consider a system designed to support a particular business process
 - New VP arrives and changes the process
 - System must now conform to the (from our perspective) arbritrary changes imposed by the VP

Conformity, continued

© Kenneth M. Anderson, 2001

- Other instances of conformity
 - Non-standard module or user interfaces
 - Arbitrary since each created by different people – not because a domain demanded a particular interface
 - Adapting to a pre-existing environment
 - May be difficult to change the environment
 - however if the environment changes, the software system is expected to adapt!
- It is difficult to plan for arbitrary change!

Changeability

- Software is constantly asked to change
 - Other things are too, however
 - manufactured things are rarely changed
 - the changes appear in later models
 - automobiles are recalled infrequently
 - buildings are expensive to remodel
- With software, the pressures are greater
 - software = functionality (plus its malleable)
 - functionality is what often needs to be changed!

Invisibility

- Software is invisible and unvisualizable
 - In contrast to things like blueprints
 - here geometry helps to identify problems and optimizations of space
 - Its hard to diagram software
 - We find that one diagram may consist of many overlapping graphs rather than just one
 - flow of control, flow of data, patterns of dependency, etc.
- This lack of visualization deprives the engineer from using the brain's powerful visual skills

Promising Attacks on Essence

- Buy vs. Build
 - Don't develop software at all!
- Rapid Prototyping
 - Brooks buys in
- Incremental Development
 - grow, not build, software
- Great designers

What about X?

- Brooks argues that past breakthroughs solve accidental difficulties
 - High-level languages
 - Time-Sharing
 - Programming Environments
- New hopefuls
 - Ada, OO Programming, AI, expert systems, "automatic" programming, etc.

No Silver Bullet Refired

- Brooks reflects on the "No Silver Bullet" paper, ten years later
 - Lots of people have argued that there methodology is the silver bullet
 - If so, they didn't meet the deadline of 10 years!
 - Other people misunderstood what Brooks calls "obscure writing"
 - For instance, when he said "accidental", he did not mean "occurring by chance"

15

March 14, 2001

16

The size of "accidental" effort

- Some people misunderstood his point with the "9/10ths" figure
 - Brooks doesn't actually think that accidental effort is 9/10th of the job
 - its much smaller than that
 - As a result, reducing it to zero (which is probably impossible) will not give you an order of magnitude improvement

Obtaining the Increase

- Some people interpreted Brooks as saying that the essence could never be attacked
 - That's not his point however; he said that no single technique could produce an order of magnitude increase by itself
- He argued that several techniques in tandem could achieve that goal but that requires industry-wide enforcement and discipline

March 14, 2001	© Kenneth M. Anderson, 2001	17	March 14, 2001	© Kenneth M. Anderson, 2001	18

Obtaining the Increase, continued

- Brooks states
 - "We will surely make substantial progress over the next 40 years; an order of magnitude over 40 years is hardly magical..."
