Deadlock

Concepts:	system deadlock: no further progress four necessary & sufficient conditions
Models:	deadlock - no eligible actions
Practice:	blocked threads

Aim: deadlock avoidance - to design systems where deadlock cannot occur.

Concurrency: Deadlock

 $\label{eq:magering} \mathbb{O} \text{Magee}/\text{Kramer } 2^{nd} \ Edition$

Deadlock: four necessary and sufficient conditions

Serially reusable resources:

the processes involved share resources which they use under mutual exclusion.

Incremental acquisition:

processes hold on to resources already allocated to them while waiting to acquire additional resources.

No pre-emption:

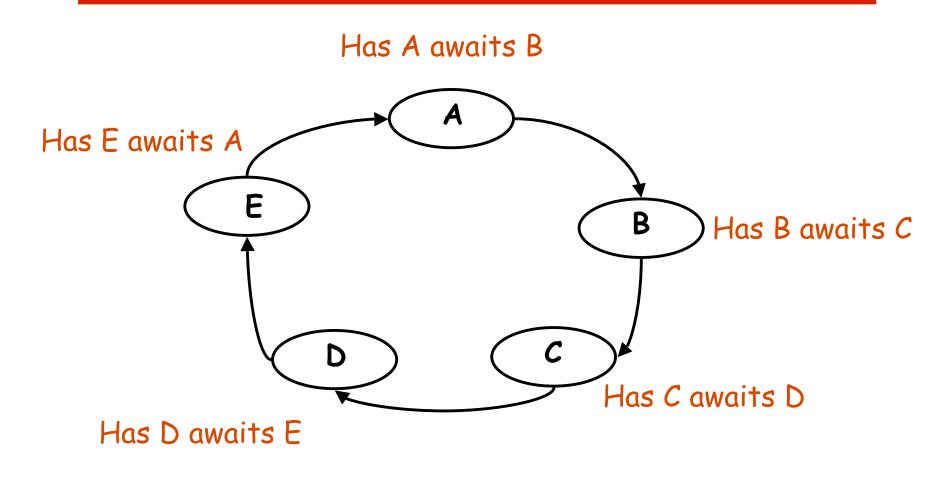

once acquired by a process, resources cannot be pre-empted (forcibly withdrawn) but are only released voluntarily.

Wait-for cycle:

a circular chain (or cycle) of processes exists such that each process holds a resource which its successor in the cycle is waiting to acquire.

Concurrency: Deadlock

Wait-for cycle

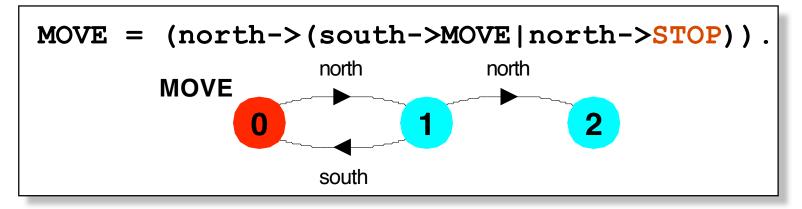

Concurrency: Deadlock

6.1 Deadlock analysis - primitive processes

- deadlocked state is one with no outgoing transitions
- In FSP: STOP process

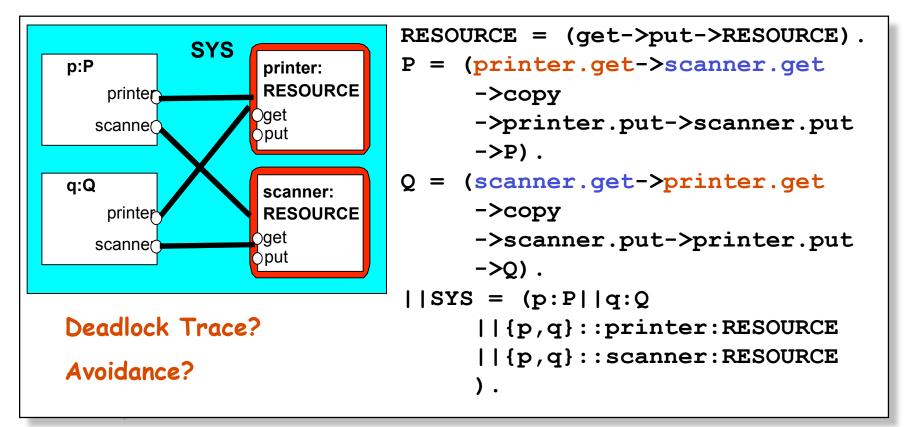

- animation to produce a trace.

Concurrency: Deadlock

©Magee/Kramer 2nd Edition

deadlock analysis - parallel composition

 in systems, deadlock may arise from the parallel composition of interacting processes.

deadlock analysis - avoidance

- acquire resources in the same order?
- Timeout:

Р	=	(printer.get-> GETSCANNER),
GETSCANNER	=	(scanner.get->copy->printer.put
		->scanner.put->P
		<pre> timeout -> printer.put->P</pre>
).
Q	=	<pre>(scanner.get-> GETPRINTER) ,</pre>
GETPRINTER	=	(printer.get->copy->printer.put
		->scanner.put->Q
		<pre>ltimeout -> scanner.put->Q</pre>
).

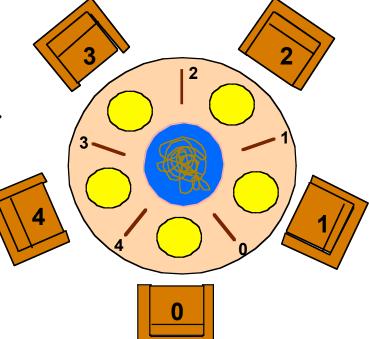

Deadlock? Progress?

Concurrency: Deadlock

6.2 Dining Philosophers

Five philosophers sit around a circular table. Each philosopher spends his life alternately thinking and eating. In the centre of the table is a large bowl of spaghetti. A philosopher needs two forks to eat a helping of spaghetti.

One fork is placed between each pair of philosophers and they agree that each will only use the fork to his immediate right and left.

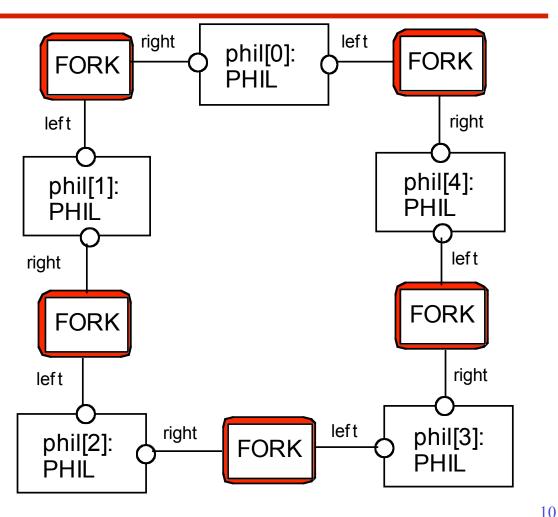

Concurrency: Deadlock

Dining Philosophers - model structure diagram

Each FORK is a shared resource with actions get and put.

When hungry, each PHIL must first get his right and left forks before he can start eating.

Concurrency: Deadlock

Dining Philosophers - model

```
FORK = (get -> put -> FORK).
PHIL = (sitdown ->right.get->left.get
        ->eat ->right.put->left.put
        ->arise->PHIL).
```

Table of philosophers:

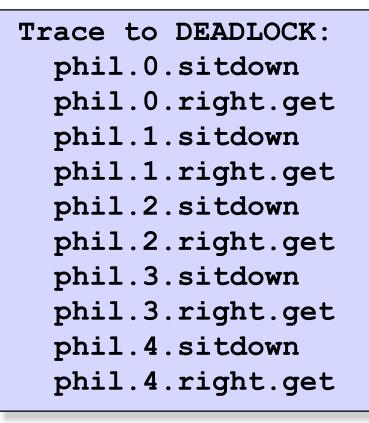

```
||DINERS(N=5) = forall [i:0..N-1]
   (phil[i]:PHIL ||
   {phil[i].left,phil[((i-1)+N)%N].right}::FORK
   ).
```

Can this system deadlock?

Concurrency: Deadlock

©Magee/Kramer 2nd Edition

Dining Philosophers - model analysis

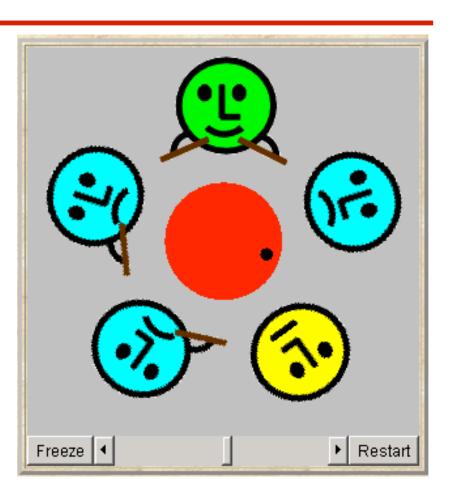

This is the situation where all the philosophers become hungry at the same time, sit down at the table and each philosopher picks up the fork to his right.

The system can make no further progress since each philosopher is waiting for a fork held by his neighbor i.e. a *wait-for cycle* exists!

Dining Philosophers

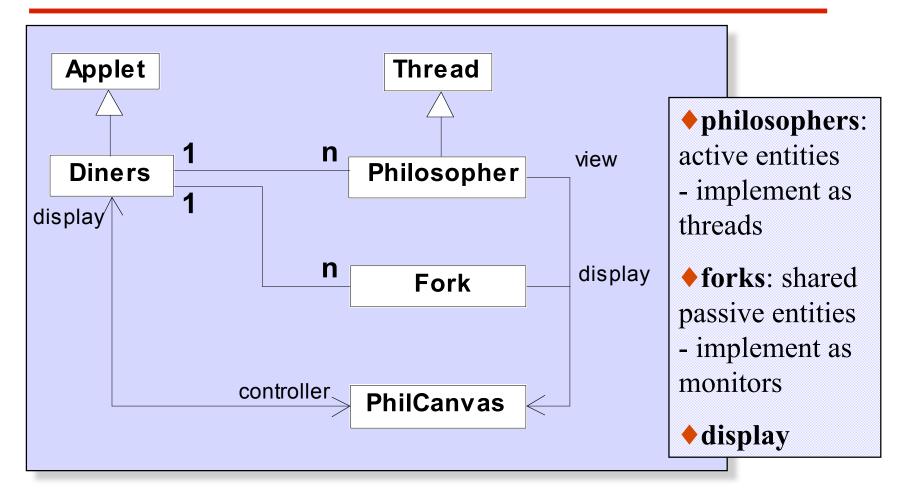

Deadlock is easily detected in our model.

How easy is it to detect a potential deadlock in an implementation?

Dining Philosophers - implementation in Java

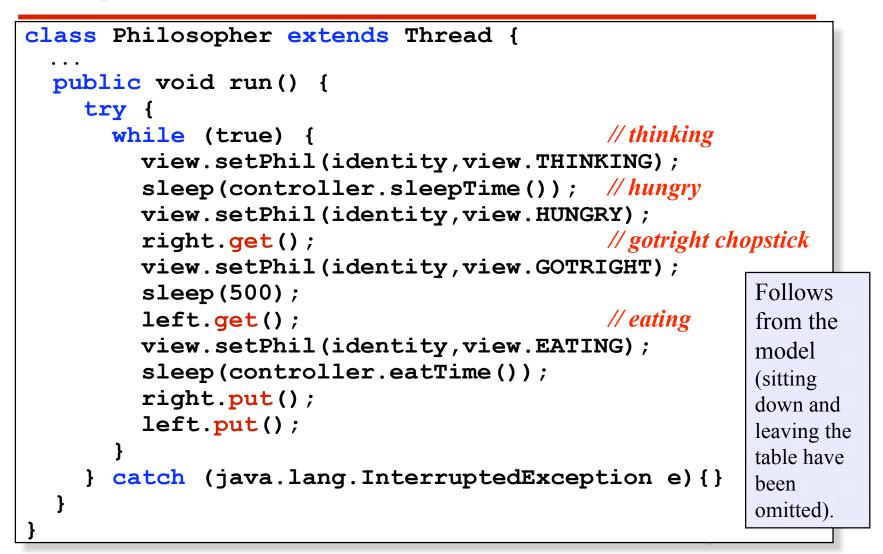

Concurrency: Deadlock

Dining Philosophers - Fork monitor

```
class Fork {
  private boolean taken=false;
                                                 taken
  private PhilCanvas display;
                                                 encodes the
  private int identity;
                                                 state of the
                                                 fork
  Fork(PhilCanvas disp, int id)
    { display = disp; identity = id; }
  synchronized void put() {
    taken=false;
    display.setFork(identity,taken);
    notify();
  }
  synchronized void get()
     throws java.lang.InterruptedException {
    while (taken) wait();
    taken=true;
    display.setFork(identity,taken);
```

Dining Philosophers - Philosopher implementation

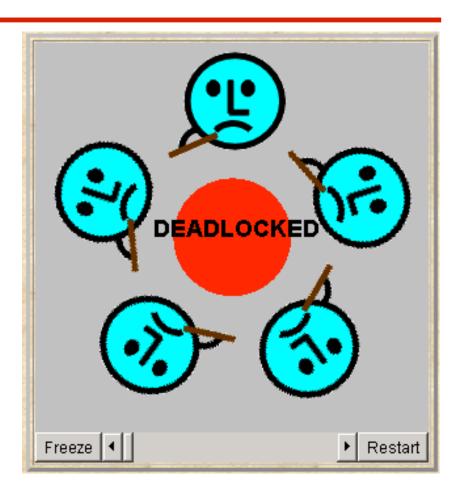

Dining Philosophers - implementation in Java

```
Code to create the philosopher
threads and fork monitors:
for (int i =0; i<N; ++i)
fork[i] = new Fork(display,i);
for (int i =0; i<N; ++i) {
  phil[i] =
    new Philosopher
       (this,i,fork[(i-1+N)%N],fork[i]);
  phil[i].start();
}
```

Dining Philosophers

To ensure deadlock occurs eventually, the slider control may be moved to the left. This reduces the time each philosopher spends thinking and eating.

This "speedup" increases the probability of deadlock occurring.

Concurrency: Deadlock

©Magee/Kramer **2nd Edition**

Deadlock-free Philosophers

Deadlock can be avoided by ensuring that a wait-for cycle

cannot exist. *How?* Introduce an *asymmetry* into our definition of philosophers.

Use the identity I of a philosopher to make even numbered philosophers get their left forks first, odd their right first.

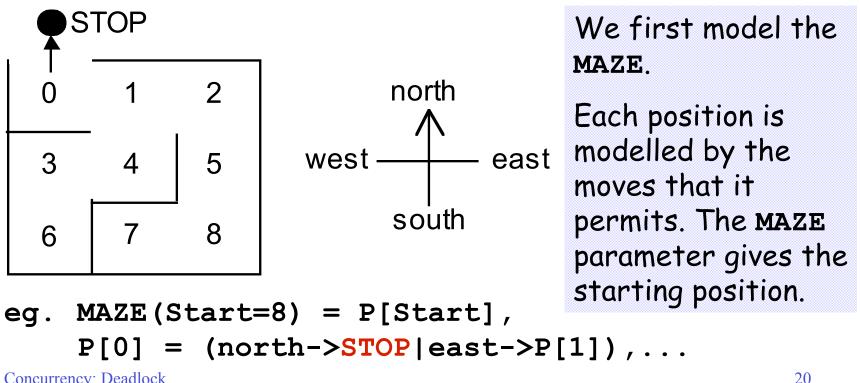

Other strategies?

```
PHIL(I=0)
  = (when (1\%2==0) sitdown
       ->left.get->right.get
       ->eat
       ->left.put->right.put
       ->arise->PHIL
    when (1%2==1) sitdown
       ->right.get->left.get
       ->eat
       ->left.put->right.put
       ->arise->PHIL
```

©Magee/Kramer 2nd Edition

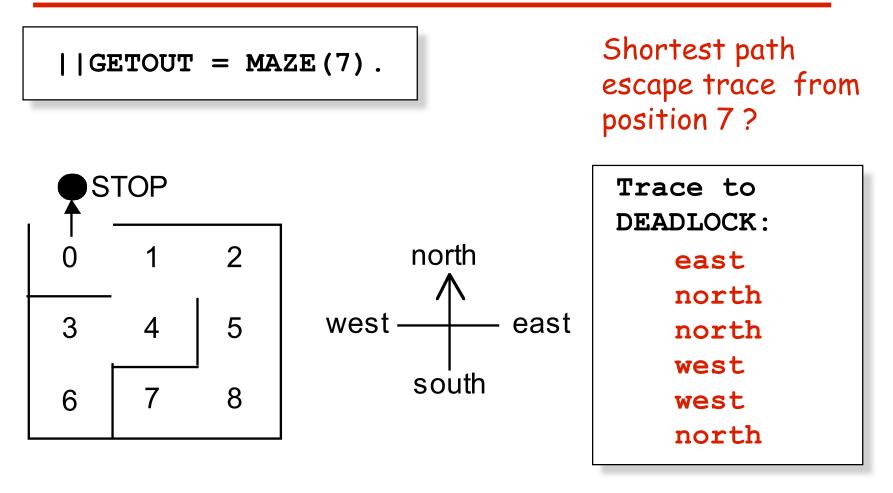

Maze example - shortest path to "deadlock"

We can exploit the shortest path trace produced by the deadlock detection mechanism of LTSA to find the shortest path out of a maze to the STOP process!

Concurrency: Deadlock

Maze example - shortest path to "deadlock"

Concurrency: Deadlock

Summary

- Concepts
 - deadlock: no futher progress
 - four necessary and sufficient conditions:
 - serially reusable resources
 - incremental acquisition
 - no preemption
 - wait-for cycle

Models

no eligable actions (analysis gives shortest path trace)

- Practice
 - blocked threads

Concurrency: Deadlock

Aim: deadlock avoidance - to design systems where deadlock cannot occur.
