Lecture 21: OO Design Methods

Object-Oriented Analysis and Design

CSCI 6448 - Spring 2001

Software Life Cycles

- A software life cycle governs the development of a software product
- Many life cycles exist including those that facilitate object-oriented analysis and design

Life cycle ≠ Notation

- This class has discussed the Unified Modeling Language, which is a notation
- A notation provides symbols to record requirements and design decisions
- Thus, the UML is not a software life cycle
- However, it can be used by many different life cycles to produce life cycle artifacts

OO Methods In general...

- Obtain customer requirements for the OO System
  - Identify scenarios or use cases
  - Build a requirements model
- Select classes and objects using basic requirements
- Identify attributes and operations for each object
- Define structures and hierarchies that organize classes
- Build an object-relationship model
- Build an object-behavior model
- Review the OO analysis model against use cases

Detailed comparisons

- What follows is a barebones description of each method, detailed comparisons can be found in:
  - Graham, I. Object-Oriented Methods, Addison-Wesley, Third Edition, 2001

Background on OO Methods

- An OO Method should cover and include
  - requirements and business process modeling
  - a lightweight, customizable process framework
  - project management
  - component architecture
  - system specification
    - use cases, UML, architecture, etc.
  - component design and decomposition
  - testing throughout the life cycle
  - QA and configuration management
  - Process Patterns

Process Patterns

- A pattern in the form of
  - Whenever your goal is A
    and your current situation is B
    then try doing C
    - (but be aware of prerequisite P, risk R, side-effect S, time-scale T, etc.)

The Booch Method

- Identify classes and objects
  - Propose candidate objects
  - Conduct behavior analysis
  - Identify relevant scenarios
  - Define attributes and operations for each class
- Identify the semantics of classes and objects
  - Select scenarios and analyze
  - Assign responsibility to achieve desired behavior
  - Partition responsibilities to balance behavior
  - Select an object and enumerate its roles and responsibilities
  - Define operations to satisfy the responsibilities

Booch, continued

- Identify relationships among classes and objects
  - Define dependencies that exist between objects
  - Describe the role of each participating object
  - Validate by walking through scenarios
- Conduct a series of refinements
  - Produce appropriate diagrams for the work conducted above
  - Define class hierarchies as appropriate
  - Perform clustering based on class commonality
- Implement classes and objects
  - In analysis and design, this means specify everything!

Coad and Yourdon Method

- Often viewed as the easiest method to learn
- Steps
  - Identify objects using "what to look for" criteria
  - Define a generalization-specification structure
  - Define a whole-part structure
  - Identify subjects (subsystem components)
  - Define attributes
  - Define services
- Coad, P. and E. Yourdon, Object-Oriented Analysis, 2nd ed., Prentice-Hall, 1991

The Jacobson Method

- Object-Oriented Software Engineering
  - Primarily distinguished by the use-case
  - Simplified model of Objectory
    - Objectory evolved into the Rational Unified Software Development Process
  - For more information on this Objectory precursor, see
    - Jacobson, I., Object-Oriented Software Engineering, Addison-Wesley, 1992.

Jacobson, continued

- Identify the users of the system and their overall responsibilities
- Build a requirements model
  - Define the actors and their responsibilities
  - Identify use cases for each actor
  - Prepare initial view of system objects and relationships
  - Review model using use cases as scenarios to determine validity
- Continued on next slide

Jacobson, continued

- Build analysis model
  - Identify interface objects using actor-interaction information
  - Create structural views of interface objects
  - Represent object behavior
  - Isolate subsystems and models for each
  - Review the model using use cases as scenarios to determine validity

The Rambaugh Method

- Object Modeling Technique (OMT)
  - Rambaugh, J. et al., Object-Oriented Modeling and Design, Prentice-Hall, 1991
- Analysis activity creates three models
  - Object model
    - Objects, classes, hierarchies, and relationships
  - Dynamic model
    - object and system behavior
  - Functional model
    - High-level Data-Flow Diagram

Rambaugh, continued

- Develop a statement of scope for the problem
- Build an object model
  - Identify classes that are relevant for the problem
  - Define attributes and associations
  - Define object links
  - Organize object classes using inheritance
- Develop a dynamic model
  - Prepare scenarios
  - Define events and develop an event trace for each scenario
  - Construct an event flow diagram and a state diagram
  - Review behavior for consistency and completeness

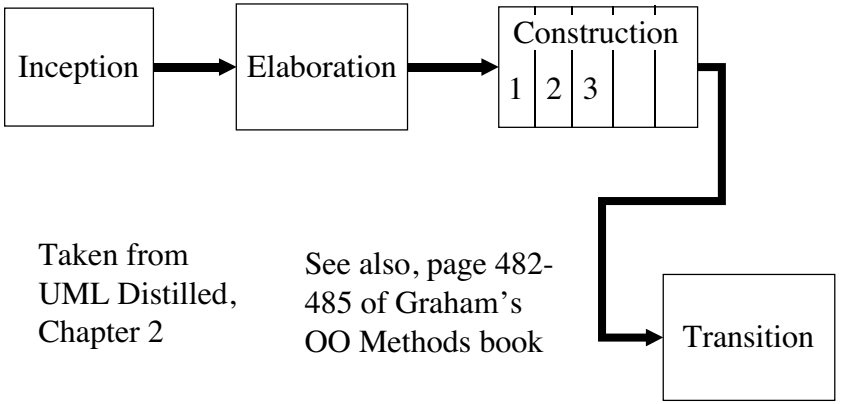
Rambaugh, continued

- Construct a functional model for the system
  - Identify inputs and outputs
  - Use data flow diagrams to represent flow transformations
  - Develop a processing specification for each process in the DFD
  - Specify constraints and optimization criteria
- Iterate!

The Wirfs-Brock Method

- Wirfs-Brock, R., B. Wilkerson, and L. Weiner, Designing Object-Oriented Software, Prentice-Hall, 1990
  - Evaluate the customer specification
  - Use a grammatical parse to extract candidate classes
  - Group classes in an attempt to identify superclasses
  - Define and assign responsibilities for each class
  - Identify relationships between classes
  - Define collaboration between classes
  - Build hierarchical representations of classes
  - Construct a collaboration graph for the system

Rational Unified Process: Overview



Taken from UML Distilled, Chapter 2

Inception

- High-level planning for the project
- Determine the project's scope
- If necessary
  - Determine business case for the project
    - Estimate cost and projected revenue

Elaboration

- Develop requirements and initial design
- Develop Plan for Construction phase
- Risk-driven approach
  - Requirements Risks
  - Technological Risks
  - Skills Risks
  - Political Risks

Requirements Risks

- Is the project technically feasible?
- Is the budget sufficient?
- Is the timeline sufficient?
- Has the user really specified the desired system?
- Do the developers understand the domain well enough?

Dealing with Requirements Risks

- Construct models to record Domain and/or Design knowledge
  - Domain model (vocabulary)
  - Use Cases (discussed next week)
  - Design model
    - Class diagrams
    - Activity diagrams
- Prototype construction

Dealing with Requirements Risks, continued.

- Begin by learning about the domain
  - Record and define jargon
  - Talk with domain experts
    - Oftentimes end-users!
- Next construct Use cases
  - What are the required external functions of the system?
  - Iterative process; Use Cases can be added as they are discovered

Dealing with Requirements Risks, continued.

- Finally, construct Design model
  - Class diagrams identify key domain concepts and their high-level relationships
  - Activity diagrams highlight the domain's work practices
    - A major task here is identifying parallelism that can be exploited later
- Be sure to consolidate iterations into a final consistent model

Dealing with Requirements Risks, continued.

- Build prototypes
  - Used only to help understand requirements
  - Throw them all out!
    - Do not be tied to an implementation too early
    - Make use of rapid prototyping tools
      - 4th Generation Programming Languages
      - Scripting and/or Interpreted environments
      - UI Builders
- Be prepared to educate the client as to the purpose of the prototype

Technology Risks

- Are you tied to a particular technology?
- Do you "own" that technology?
- Do you understand how different technologies interact?
- Techniques
  - Prototypes!
  - Class diagrams, package diagrams

Skill Risks

- Do the members of the project team have the necessary skills and background to tackle the project?
- If not
  - Training, Consulting, Mentoring and Hiring new people are available options!

Political Risks

- How well does the proposed project mesh with corporate culture?
  - Consider the attempt to use Lotus Notes at Arthur Anderson
    - Lotus Notes attempts to promote collaboration
    - Arthur Anderson consultants compete with each other!
  - Consider e-mail: any employee can ignore the org chart and mail the CEO!

Political Risks, continued

- Will the project directly compete with another business unit?
- Will it be at odds with some higher level manager's business plan?
- Any of these can kill a project…
- Examples from students?

Ending Elaboration

- Baseline architecture Constructed
  - List of Use cases (with estimates)
  - Domain Model
  - Technology Platform
- AND
  - Risks identified
  - Plan constructed
    - Use cases assigned to iterations

Construction

- Each iteration produces a software product that implements the assigned Use cases
  - Additional analysis and design may be necessary as the implementation details get addressed for the first time
- Extensive testing should be performed and the product should be released to (some subset of) the client for early feedback

Transition

- Final phase before release 1.0
- Optimizations can now be performed
  - Optimizing too early may result in the wrong part of the system being optimized
  - Largest boosts in performance come from replacing non-scalable algorithms or mitigating bottlenecks

Missing Phase?

- What happened to Operation and Maintenance?
  - The construction phase is iterative. Each iteration produces a product that can be externally delivered. Feedback from that product can drive the next iteration
- Thus, maintenance would be an iteration occurring after transition

Maintenance
