CSCI 5582 Fall 2006

Today 10/17

- Review basics
- More on independence
- Break
- Bayesian Belief Nets

CSCI 5582 Fall 2006

Review

- Joint Distributions
- Atomic Events
- Independence assumptions

CSCI 5582 Fall 2006

Review: Joint Distribution

	Toothache=True	Toothache=False
Cavity True	0.04	0.06
Cavity False	0.01	0.89

•Each cell represents a conjunction of the variables in the model.

CSCI 5582 Fall 2006

Atomic Events

- The entries in the table represent the probabilities of **atomic events**
 - Events where the values of all the variables are specified

CSCI 5582 Fall 2006

Independence

- Two variables A and B are independent iff $P(A|B) = P(A)$. In other words, knowing B gives you no information about A .
- Or $P(A \wedge B) = P(A|B)P(B) = P(A)P(B)$
 - I.e. Two coin tosses

CSCI 5582 Fall 2006

Mental Exercise

- With a fair coin which of the following two sequences is more likely?
 - HHHHHTTTTT
 - HTTHHHTHTT

CSCI 5582 Fall 2006

Conditional Independence

- Consider the dentist problem with 3 variables: cavity, toothache, catch
- If I have a cavity, then the chances that there will be a catch is independent of whether or not I have a toothache as well. I.e.
 - $P(\text{Catch}|\text{Cavity} \wedge \text{Toothache}) = P(\text{Catch}|\text{Cavity})$

CSCI 5582 Fall 2006

Conditional Independence

- Remember that having the joint distribution over N variables allows you to answer all the questions involving those variables.
- Exploiting conditional independence allows us to represent the complete joint distribution with fewer entries.
 - I.e. Fewer than the 2^N normally needed

CSCI 5582 Fall 2006

Conditional Independence

- $P(\text{Cavity}, \text{Catch}, \text{Toothache})$
= $P(\text{Cavity})P(\text{Catch}, \text{Toothache} | \text{Cavity})$
= $P(\text{Cavity})P(\text{Catch} | \text{Cavity})P(\text{Toothache} | \text{Cavity})$

CSCI 5582 Fall 2006

Conditional Independence

- $P(\text{Cavity}, \text{Catch}, \text{Toothache})$
= $P(\text{Catch})P(\text{Cavity}, \text{Toothache} | \text{Catch})$
⇒ Huh?

CSCI 5582 Fall 2006

Bayesian Belief Nets

- A compact notation for representing conditional independence assumptions and hence a compact way of representing a joint distribution.
- **Syntax:**
 - A directed acyclic graph, one node per variable
 - Each node augmented with local conditional probability tables

CSCI 5582 Fall 2006

Bayesian Belief Nets

- Nodes with no incoming arcs (root nodes) simply have priors associated with them
- Nodes with incoming arcs have tables enumerating the
 - $P(\text{Node}|\text{Conjunction of Parents})$
 - Where parent means the node at the other end of the incoming arc

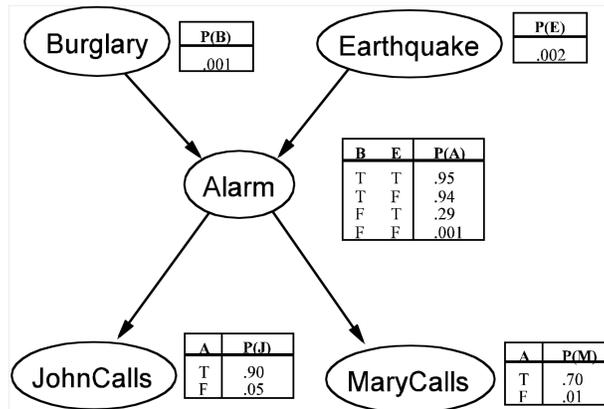

CSCI 5582 Fall 2006

Alarm Example

- Variables: *Burglar, MaryCalls, JohnCalls, Earthquake, Alarm*
- Network topology captures the domain causality (conditional independence assumptions).

CSCI 5582 Fall 2006

Alarm Example

CSCI 5582 Fall 2006

Bayesian Belief Nets: Semantics

- The full joint distribution for the N variables in a Belief Net can be recovered from the information in the tables.

$$P(X_1, \dots, X_N) = \prod_{i=1}^N P(X_i \mid \text{Parents}(X_i))$$

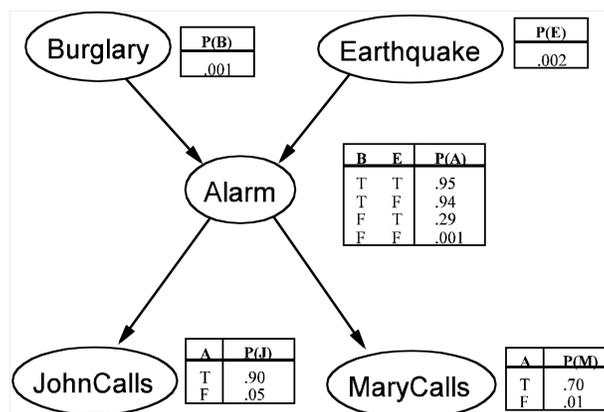

CSCI 5582 Fall 2006

Belief Net Semantics Alarm Example

- What are the chances of John calls, Mary calls, alarm is going off, no burglary, no earthquake?

CSCI 5582 Fall 2006

Alarm Example

CSCI 5582 Fall 2006

Alarm Example

- $P(J \wedge M \wedge A \wedge \sim B \wedge \sim E) =$

$$P(J|A) * P(M|A) * P(A|\sim B \wedge \sim E) * P(\sim B) * P(\sim E)$$
$$0.9 * 0.7 * .001 * .999 * .998$$

- In other words, the probability of atomic events can be read right off the network as the product of the probability of the entries for each variable

CSCI 5582 Fall 2006

Events

- What about non-atomic events?
- Remember to partition. Any event can be defined as a combination of other more well-specified events.
 $P(A) = P(A \wedge B) + P(A \wedge \sim B)$
- So what's the probability that Mary calls out of the blue?

CSCI 5582 Fall 2006

Events

- $P(M \wedge J \wedge E \wedge B \wedge A) +$
 $P(M \wedge J \wedge E \wedge B \wedge \sim A) +$
 $P(M \wedge J \wedge E \wedge \sim B \wedge A) +$
...

CSCI 5582 Fall 2006

Events

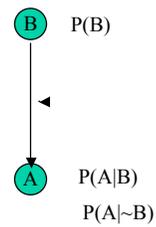

- How about $P(M | \text{Alarm})$?
 - Trick question... that's something we know
- How about $P(M | \text{Earthquake})$?
 - Not directly in the network
rewrite as
 $P(M \wedge \text{Earthquake}) / P(\text{Earthquake})$

CSCI 5582 Fall 2006

Simpler Examples

- Let's say we have two variables A and B , and we know B influences A .

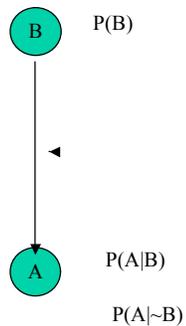

- What's $P(A \wedge B)$?

CSCI 5582 Fall 2006

Simple Example

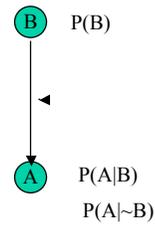

- Now I tell you that B has happened.
- What's your belief in A ?

CSCI 5582 Fall 2006

Simple Example

- Suppose instead I say A has happened
- What's your belief in B ?

CSCI 5582 Fall 2006

Simple Example

$$\begin{aligned} \bullet P(B|A) &= P(B \wedge A) / P(A) \\ &= P(B \wedge A) / (P(A \wedge B) + P(A \wedge \sim B)) \\ &= \frac{P(B)P(A|B)}{P(B)P(A|B) + P(\sim B)P(A|\sim B)} \end{aligned}$$

CSCI 5582 Fall 2006

Chain Rule Basis

$$\begin{aligned} &P(B,E,A,J,M) \\ &P(M|B,E,A,J) \underbrace{P(B,E,A,J)} \\ &\quad P(J|B,E,A) \underbrace{P(B,E,A)} \\ &\quad\quad P(A|B,E) \underbrace{P(B,E)} \\ &\quad\quad\quad P(B|E)P(E) \end{aligned}$$

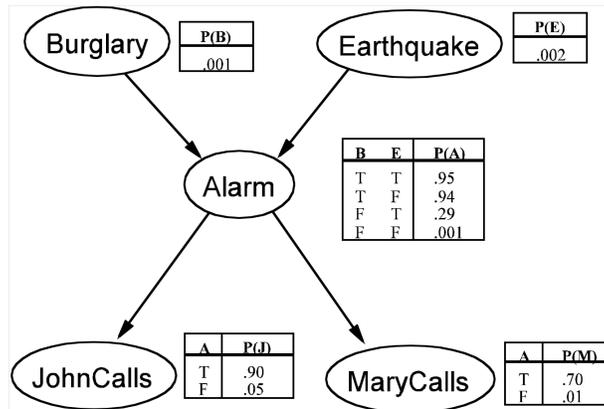

CSCI 5582 Fall 2006

Chain Rule Basis

- $P(B,E,A,J,M)$
- $P(M|B,E,A,J)P(J|B,E,A)P(A|B,E)P(B|E)P(E)$
- $P(M|A) \quad P(J|A) \quad P(A|B,E)P(B)P(E)$

CSCI 5582 Fall 2006

Alarm Example

CSCI 5582 Fall 2006

Details

- Where do the graphs come from?
 - Initially, the intuitions of domain experts
- Where do the numbers come from?
 - Hopefully, from hard data
 - Sometimes from experts intuitions
- How can we compute things efficiently?
 - Exactly by not redoing things unnecessarily
 - By approximating things

CSCI 5582 Fall 2006

Break

- Readings for probability
 - 13: All
 - 14:
 - 492-498, 500, Sec 14.4

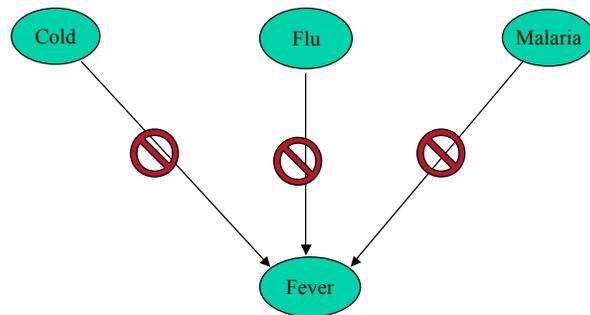

CSCI 5582 Fall 2006

Noisy-Or

- Even with the reduction in the number of probabilities needed it's hard to accumulate all the numbers you need.
- Especially true when some evidence variables are shared among many causes.
- The Noisy-Or hack is a useful short-cut.
- $P(A|C1 \wedge C2 \wedge C3)$

CSCI 5582 Fall 2006

Noisy-Or

CSCI 5582 Fall 2006

Noisy Or

- $P(\text{Fever}|\text{Cold})$
- $P(\text{Fever}|\text{Malaria})$
- $P(\text{Fever}|\text{Flu})$
- $P(\sim\text{Fever}|\text{Cold})$
- $P(\sim\text{Fever}|\text{Malaria})$
- $P(\sim\text{Fever}|\text{Flu})$

CSCI 5582 Fall 2006

Noisy Or

- What does it mean for the  to occur?
- It means the cause was true and the symptom didn't happen
- What's the probability of that?
 - $P(\sim\text{Fever}|\text{Cause})$
 - $P(\sim\text{Fever}|\text{Flu}), \text{etc}$

CSCI 5582 Fall 2006

Noisy Or

- If all three causes are true and you don't have a fever then all three blockers  are in effect
- What's the probability of that?
 - $P(\sim\text{Fever}|\text{flu,cold,malaria})$
 - $P(\sim\text{Fever}|\text{flu})P(\sim\text{Fever}|\text{cold})P(\sim\text{Fever}|\text{malaria})$
- But $1 - \text{that} = P(\text{Fever}|\text{causes})$

CSCI 5582 Fall 2006

Computing with BBNs

- Normal scenario
 - You have a belief net consisting of a bunch of variables
 - Some of which you know to be true (evidence)
 - Some of which you're asking about (query)
 - Some you haven't specified (hidden)

CSCI 5582 Fall 2006

Example

- Probability that there's a burglary given that John and Mary are calling
- $P(B|J,M)$
 - B is the query variable
 - J and M are evidence variables
 - A and E are hidden variables

CSCI 5582 Fall 2006

Example

- Probability that there's a burglary given that John and Mary are calling

- $P(B|J,M) = \alpha P(B,J,M)$

$$= \alpha *$$

$$P(B,J,M,A,E) +$$

$$P(B,J,M,\sim A,E) +$$

$$P(B,J,M,A,\sim E) +$$

$$P(B,J,M,\sim A,\sim E)$$

CSCI 5582 Fall 2006

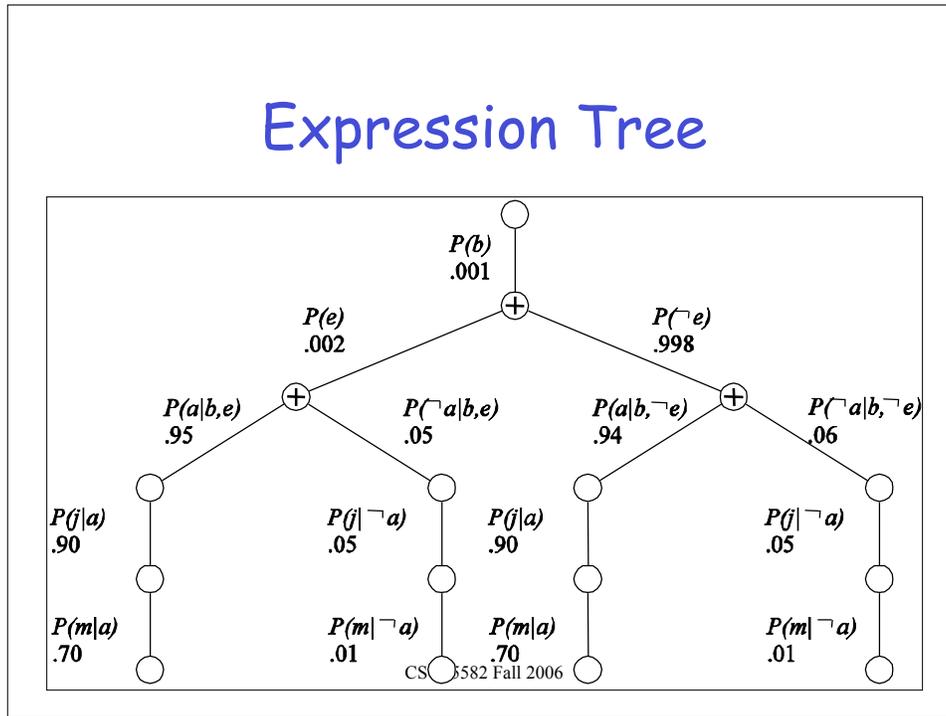

From the Network

$$\alpha \sum_e \sum_a P(B)P(E)P(A|B,E)P(J|A)P(M|A)$$

$$\alpha P(B) \sum_e P(E) \sum_a P(A|B,E)P(J|A)P(M|A)$$

CSCI 5582 Fall 2006

Expression Tree

Speedups

- Don't recompute things.
 - Dynamic programming
- Don't compute some things at all
 - Ignore variables that can't effect the outcome.

Example

- John calls given burglary
- $P(J|B)$

$$\alpha P(B) \sum_e P(E) \sum_a P(A|B, E) P(J|a) \sum_m P(M|A)$$

CSCI 5582 Fall 2006

Variable Elimination

- Every variable that is not an ancestor of a query variable or an evidence variable is irrelevant to the query
